Boss Design task chair revolutionizes office seating

A new task chair by Boss Design is on course to take the US market by storm. Having blazed a trail across Europe, **Trinetic** has already set the benchmark against which future task chairs are being compared.

Trinetic incorporates a brand new type of movement that creates a superior and completely natural user experience. With no manual user adjustments required, it uses three independent pivot points to create a chair that 'follows' rather than resists the user. This promotes better support through a wide range of body movements, and is proven to increase contact with the user's body through the full length of the seat and back surface compared to traditional synchronised mechanisms. This provides greater comfort and encourages a more dynamic user experience.

Boasting a sophisticated and refined aesthetic, Trinetic is built around an aluminium cradle which can be finished in a wide array of styles. It can be supplied in any combination of mesh, fabric or leather seat and backrest, together with a choice of four and five-star base options. It is ideal for flexible working and for those who want a task chair, but can also be specified as a touchdown work, meeting or conference chair.

Commenting on this groundbreaking chair, Jeff Thompson, President of Boss Design North America says: “Trinetic has revolutionized office task chairs as we know them. With wellbeing in the workplace a major consideration, Trinetic delivers numerous ergonomic benefits that include; improved contact and support; better pressure distribution and a better fit for a broad range of user shapes and sizes, without placing the emphasis on the user to make any adjustments. The absence of a lockable backrest also encourages users to remain dynamic; avoiding static postures - the primary cause of musculoskeletal stress.”

Jeff continues: “Commercially, Trinetic also demonstrates tangible advantages by reducing the need for training - a significant financial burden to clients and manufacturers alike. Instead, the Trinetic video can be uploaded onto our clients’ intranets in order to educate users of the product’s benefits.”
